Project(R,A)	GroupCount(R,A)
Create a new relation that retains only the attributes A taken from R.	Create a new relation consisting of unique tuples of the attributes A and counts of the sizes of
Category:	corresponding grouped sets of tuples.
Notes:	Category:
	Notes:
Select(R,C)	
Create a new relation including only tuples from R	GroupSum(R,A,B)
that satisfy C	Create a new relation consisting of unique tuples of
Category:	the attributes A and the sums of the attributes B over the corresponding grouped sets of tuples.
Notes:	Category:
	Notes:
DupElim(R)	
Create a new relation from R by including each unique tuple exactly once	GroupAvg(R,A,B)
Category:	Create a new relation consisting of unique tuples of
Notes:	the attributes A and the averages of the attributes B over the corresponding grouped sets of tuples.
	Category:
GroupMin(R,A,B)	Notes:
Create a new relation consisting of unique tuples of the attributes A and the minima of the attributes B over the corresponding grouped sets of tuples.	SetUnion(R,S)
Category:	Create a new relation containing each of the unique tuples found in either R or S.
Notes:	Category:
	Notes:
GroupMax(R,A,B)	
Create a new relation consisting of unique tuples of the attributes A and the maxima of the attributes B	BagUnion(R,S)
over the corresponding grouped sets of tuples.	Create a new relation containing each of the tuples found in either R or S (including duplicates).
Category:	Category:
Notes:	Notes:

SetIntersection(R,S)	NaturalJoin(R,S)
Create a new relation containing each of the unique tuples found in both R and S.	Create a new relation containing concatenations of a tuple from R with a tuple from S, where the
Category:	tuples match on shared attributes.
Notes:	Category:
	Notes:
BagIntersection(R,S)	
Create a new relation containing each tuple found in both R and S, repeated the lesser of their number of occurrences in each.	NestedLoopJoin(R,S)
	Create a new relation containing concatenations of a tuple from R with a tuple from S, where the tuples match on shared attributes.
Category:	
Notes:	Category:
	Notes:
SetDifference(R,S)	
Create a new relation containing each unique tuple	Sort (R)
found in R but not in S	Applies a two-phase multiway merge sort on R.
Category:	Category:
Notes:	Notes:
BagDifference(R,S)	SortDupElim(R)
Create a new relation containing each unique tuple found in R more often than S, as many times as	Uses merge sort to eliminate duplicates in large relation R
there are excess appearances in R	Category:
Category:	Notes:
Notes:	
	SortGroupAgg(R,A,G)
Product(R,S)	Uses merge sort to compute some aggregated
Create a new relation containing every possible concatenation of a tuple from R with a tuple from	property G of tuples from large relation R, as grouped by attributes A
S.	Category:
Category:	Notes:
Notes:	

SortUnion(R,S)	HashGroupAgg(R,A,G)
Uses merge sort to take the union of large relations R and S	Uses hashing to compute some aggregated property G of tuples from large relation R, as
Category:	grouped by attributes A
Notes:	Category:
	Notes:
SortIntersection(R,S)	
Uses merge sort to take the intersection of large relations R and S	HashUnion(R,S)
	Uses hashing to take the union of large relations R and S
Category: Notes:	Category:
	Notes:
SortDifference(R,S)	
Uses merge sort to take the set difference of large	HashIntersection(R,S)
relations R and S	Uses hashing to take the intersection of large relations R and S
Category: Notes:	Category:
	Notes:
SortJoin(R,S)	
Uses merge sort to produce a join of large relations R and S	HashDifference(R,S)
	Category:
Category:	Notes:
Notes:	
	HashJoin(R,S)
HashDupElim(R)	Uses hashing to produce a join of large relations R and S
Uses hashing to eliminate duplicates in large relation R	Category:
Category:	Notes:
Notes:	

Uses an index to select tuples from R matching condition C on A
Category:
Notes:
SortedIndexJoin(R,S)
Uses a sorted index to produce a join of large relations R and S
Category:

IndexSelect(R,A)

Notes:
